

Create a Collection for API Requests

Step-by-Step Guide to Creating a New Collection in Postman

Hands-On	3
Scenario	Create the Collections for API Request
Tool	Postman (Desktop or Web)
Duration	5 minutes
Prerequisite	Postman installed and a workspace already created

Objective

The objective of this assignment is to create a **Collection** inside a Postman workspace. A Collection is a folder-like container that holds a group of related API requests. Collections make it easy to organize, share, document, and run API requests in a structured manner.

What is a Collection?

In Postman, a **Collection** is a logical grouping of API requests. It is similar to a folder that stores related requests together. Collections offer the following benefits:

- **Organization** — Group all requests for a specific API or feature under one container.
- **Reusability** — Reuse requests across different environments without rewriting them.
- **Automation** — Run all requests in a collection sequentially using the Collection Runner or Newman CLI.
- **Documentation** — Auto-generate API documentation from the requests in a collection.
- **Sharing** — Export collections as JSON files or share them with team members through the workspace.

Steps to Create a Collection

1 Open Postman

Launch the **Postman** application on the desktop, or open the web version by visiting <https://web.postman.co/>.

Sign in if not already logged in, and select the workspace where the new collection should be created (for example, the workspace created in the previous assignment).

2 Click on the “New” Button

On the Postman interface, locate the **New** button in the top-left corner (just below the Workspaces dropdown).

Click the **New** button. A pop-up window titled *Create New* will appear, displaying the various Postman entities that can be created.

3 Select “Collection”

From the *Create New* pop-up window, browse the list of available item types (HTTP Request, Collection, Environment, Workspace, API, Mock Server, Monitor, etc.).

Click on **Collection** to start creating a new collection.

Postman will close the pop-up and open a new untitled collection in the left sidebar, ready to be named.

4 Name the Collection

An editable text field for the collection name will appear at the top of the new collection's panel.

Type a **meaningful name** that reflects the purpose of the collection — for example, *Bitcoin Rate API Tests*, *User Management APIs* or *CoinDesk APIs*.

Press **Enter** to save the name. A clear, descriptive name makes it easy to identify and locate the collection later in the workspace.

Optionally, click the **Description** tab on the collection's overview page to add a short description explaining what the collection contains.

Verification

To confirm the collection was created successfully:

- 1 Look at the left sidebar — the new collection name should appear under the **Collections** tab.
- 2 Click on the collection name to open its overview page; the name and description entered should be displayed.
- 3 The collection initially contains 0 requests; new requests can be added by clicking **Add a request** inside the collection.

Conclusion

A new **Collection** has been successfully created inside the Postman workspace. The collection is now ready to hold API requests, scripts, and tests for the upcoming assignments — including sending GET requests to the Bitcoin Rate API, validating status codes, and extracting currency-specific data such as USD, GBP, and EUR rates.

Tip: Collections can later be renamed, duplicated, exported as JSON, or deleted using the three-dot (...) menu next to the collection name in the left sidebar.
