

Postman Installation Guide

Step-by-Step Setup of Postman on a Windows System

Hands-On	1
Scenario	Download Postman
Platform	Windows (Mac / Linux also supported)
Duration	10 minutes
Tool	Postman Standalone Application
Source URL	https://www.postman.com/downloads/

Objective

The objective of this assignment is to install the Postman standalone application on a Windows system so it can be used to send, test, and automate API requests. Postman is one of the most widely used API client tools and is essential for backend development, QA testing, and API documentation work.

Prerequisites

Before starting the installation, the following are required:

- A Windows 7 / 8 / 10 / 11 system (64-bit recommended)
- Active internet connection to download the installer
- Sufficient disk space (approximately 250 MB)
- A modern web browser (Chrome, Edge, Firefox, etc.)
- A valid email address (only if creating a new Postman account)

Installation Steps

1 Download Postman Standalone

Open a web browser and navigate to <https://www.postman.com/downloads/>.

Choose the desired platform from the available options: **Mac**, **Windows**, or **Linux**.

For Windows, select either **Windows 64-bit** or **Windows 32-bit** depending on the system architecture.

Click the **Download** button to start the download.

2 Run the Installer

Once the download is complete, locate the installer file **Postman-win64-Setup.exe** in the Downloads folder.

Double-click the file to launch the installer.

If a Windows User Account Control (UAC) prompt appears, click **Yes** to allow the installer to run.

3 Installation Wizard

When the Postman setup wizard appears, follow the on-screen instructions:

- Accept the **License Agreement** by clicking *I Agree*.
- Choose the **installation location** or use the default path (typically `C:\Users\<User>\AppData\Local\Postman`).
- Select additional options such as **creating a desktop shortcut** if required.
- Click **Install** to begin the installation process.

4 Launch Postman

Once the installation is complete, the wizard displays a confirmation screen.

Tick the **Run Postman** checkbox in the final step of the installation wizard.

Click **Finish** to close the wizard and launch the application automatically.

5 Sign In or Create an Account

When Postman launches for the first time, the welcome screen appears.

Existing users can **Sign In** using their registered email and password.

New users can click **Create Free Account** and complete a quick registration with email, username and password.

It is also possible to continue without signing in by clicking *Skip and go to the app*, although signing in enables cloud-sync of collections, environments and history.

6 Save Workspace Preferences

After signing in, Postman displays a **Save My Preferences** page.

Select the workspace tools that suit the tester's role (for example: API Testing, API Documentation, API Design).

Click **Save My Preferences** to apply the selections.

These preferences personalise the Postman dashboard and quick-access tools.

7 Installation Completed

The Postman home screen now appears, indicating that the application has been **successfully installed** on the Windows system.

Postman is now ready to be used for sending API requests, building collections, and writing automated tests.

Verification

To confirm Postman is installed correctly, perform the following quick check:

- 1 Open Postman from the Start Menu or Desktop shortcut.
- 2 Click the + tab to open a new request.
- 3 Set the request type to **GET** and enter the URL: <https://api.coindesk.com/v1/bpi/currentprice.json>
- 4 Click **Send**. A JSON response should be returned with status **200 OK**.

Conclusion

The Postman standalone application has been successfully downloaded and installed on the Windows system. The tool is now ready to be used for API testing, request automation, collection management, and integration with test frameworks like REST Assured and TestNG in subsequent assignments.

Note: The same procedure applies to Mac and Linux platforms. Only the installer file format differs — .dmg for Mac and .tar.gz for Linux.
