

Create Workspace for API Requests

Step-by-Step Guide to Creating a New Workspace in Postman

Hands-On	2
Scenario	Create Workspace for API Request
Tool	Postman (Desktop or Web)
Duration	10 minutes
Prerequisite	Postman installed and signed in

Objective

The objective of this assignment is to create a dedicated **Workspace** in Postman that will be used to organize API requests, collections, environments, and test scripts. A workspace acts as a central hub where individual testers or teams can group related API artifacts, collaborate, and manage their work efficiently.

Why Use a Workspace?

Postman workspaces are useful for the following reasons:

- **Organization** — Group related collections, environments, and APIs in one place.
- **Collaboration** — Share workspaces with team members and work on APIs together in real time.
- **Access Control** — Decide who can view or edit the workspace (Personal, Private, Team or Public).
- **Version Control** — Track changes made to collections and environments inside the workspace.

Steps to Create a Workspace

1 Open Postman

Launch the **Postman** application on the desktop, or open the web version by visiting <https://web.postman.co/>.

Sign in with the registered Postman account credentials. The Postman home dashboard will be displayed once login is successful.

2 Click on the “Workspaces” Button

On the upper-left corner of the Postman window, locate and click the **Workspaces** dropdown button.

A dropdown menu will appear listing all available workspaces such as *My Workspace* and any team workspaces.

At the bottom of the dropdown, click the **Create Workspace** button to start creating a new workspace.

3 Select a Workspace Template

On the **Create Workspace** screen, Postman displays a list of ready-made **Workspace Templates**.

Select a template that fits the use-case (for example: API Testing, API Development, API Publishing). Each template pre-populates the workspace with helpful sample collections, environments and documentation.

Alternatively, choose **Blank Workspace** to start with a clean, empty workspace and add custom collections later.

Click **Next** to continue.

4 Name the Workspace and Set Access

Enter a meaningful and descriptive **Name** for the workspace (for example: *Bitcoin API Tests* or *QA-API-Workspace*).

Optionally, provide a short **Summary** describing the workspace's purpose — this helps team members understand its scope.

Choose **Who can access this workspace**. The available options are:

- **Personal** — visible only to the creator.
- **Private** — visible to selected invited members.
- **Team** — visible to everyone in the team.
- **Public** — visible to anyone on the internet.

Click **Create** to complete the workspace creation. The new workspace will open immediately and is ready for use.

Verification

To confirm the workspace was created successfully:

- 1 Click the **Workspaces** dropdown again — the new workspace name should now appear in the list.
- 2 The Postman header should display the new workspace name as the currently active workspace.
- 3 The left sidebar should now show empty sections for **Collections**, **Environments**, **APIs**, **Mock Servers**, **Monitors**, and **History**.

Conclusion

A new Postman **Workspace** has been successfully created. This workspace will serve as the working area for the upcoming assignments — sending API requests, organizing collections, managing environments, and running automated tests against the Bitcoin Rate API.

Tip: Workspaces can later be renamed, archived or deleted from the workspace settings menu (the gear icon on the workspace dashboard).
